537. Complex Number Multiplication

Description

A complex number can be represented as a string on the form `"real+imaginary i"` where:

- `real` is the real part and is an integer in the range `[-100, 100]`.
- `imaginary` is the imaginary part and is an integer in the range `[-100, 100]`.
- $i^2 == -1$.

Given two complex numbers `num1` and `num2` as strings, return *a string of the complex number that represents their multiplications*.

Example 1:

```
Input: num1 = "1+1i", num2 = "1+1i"
Output: "0+2i"
Explanation: (1 + i) * (1 + i) = 1 + i2 + 2 * i = 2i, and you need convert it to the form of 0+2i.
```

Example 2:

```
Input: num1 = "1+-1i", num2 = "1+-1i"
Output: "0+-2i"
Explanation: (1 - i) * (1 - i) = 1 + i2 - 2 * i = -2i, and you need convert it to the form of 0+-2i.
```

Constraints:

- `num1` and `num2` are valid complex numbers.
