3062. Winner of the Linked List Game

Description

You are given the `head` of a linked list of **even** length containing integers.

Each **odd-indexed** node contains an odd integer and each **even-indexed** node contains an even integer.

We call each even-indexed node and its next node a **pair**, e.g., the nodes with indices `0` and `1` are a pair, the nodes with indices `2` and `3` are a pair, and so on.

For every **pair**, we compare the values of the nodes in the pair:

- If the odd-indexed node is higher, the `"Odd"` team gets a point.
- If the even-indexed node is higher, the `"Even"` team gets a point.

Return *the name of the team with the **higher** points, if the points are equal, return* `"Tie"`.

Example 1:

Input: `head = [2,1]`

Output: `"Even"`

Explanation: There is only one pair in this linked list and that is `(2,1)`. Since `2 > 1`, the Even team gets the point.

Hence, the answer would be `"Even"`.

Example 2:

Input: `head = [2,5,4,7,20,5]`

Output: `"Odd"`

Explanation: There are `3` pairs in this linked list. Let's investigate each pair individually:

`(2,5)` -> Since `2 < 5`, The Odd team gets the point.

`(4,7)` -> Since `4 < 7`, The Odd team gets the point.

`(20,5)` -> Since `20 > 5`, The Even team gets the point.

The Odd team earned `2` points while the Even team got `1` point and the Odd team has the higher points.

Hence, the answer would be `"Odd"`.

Example 3:

Input: `head = [4,5,2,1]`

Output: `"Tie"`

Explanation: There are `2` pairs in this linked list. Let's investigate each pair individually:

`(4,5)` -> Since `4 < 5`, the Odd team gets the point.

`(2,1)` -> Since `2 > 1`, the Even team gets the point.

Both teams earned `1` point.

Hence, the answer would be `"Tie"`.

Constraints:

- The number of nodes in the list is in the range `[2, 100]`.
- The number of nodes in the list is even.
- `1 <= Node.val <= 100`
- The value of each odd-indexed node is odd.
- The value of each even-indexed node is even.
