2389. Longest Subsequence With Limited Sum

Description

You are given an integer array `nums` of length `n`, and an integer array `queries` of length `m`.

Return *an array* `answer` *of length* `m` *where* `answer[i]` *is the* ***maximum*** *size of a* ***subsequence*** *that you can take from* `nums` *such that the* ***sum*** *of its elements is less than or equal to* `queries[i]`.

A **subsequence** is an array that can be derived from another array by deleting some or no elements without changing the order of the remaining elements.

Example 1:

```
Input: nums = [4,5,2,1], queries = [3,10,21]
Output: [2,3,4]
Explanation: We answer the queries as follows:
- The subsequence [2,1] has a sum less than or equal to 3. It can be proven that 2 is the maximum size of such a subsequence, so answer[0] = 2.
- The subsequence [4,5,1] has a sum less than or equal to 10. It can be proven that 3 is the maximum size of such a subsequence, so answer[1] = 3.
- The subsequence [4,5,2,1] has a sum less than or equal to 21. It can be proven that 4 is the maximum size of such a subsequence, so answer[2] = 4.
```

Example 2:

```
Input: nums = [2,3,4,5], queries = [1]
Output: [0]
Explanation: The empty subsequence is the only subsequence that has a sum less than or equal to 1, so answer[0] = 0.
```

Constraints:

- `n == nums.length`
- `m == queries.length`
- `1 <= n, m <= 1000`
- `1 <= nums[i], queries[i] <= 10^6`
