

# 2060. Check if an Original String Exists Given Two Encoded Strings

## Description

An original string, consisting of lowercase English letters, can be encoded by the following steps:

- Arbitrarily **split** it into a **sequence** of some number of **non-empty** substrings.
- Arbitrarily choose some elements (possibly none) of the sequence, and **replace** each with **its length** (as a numeric string).
- **Concatenate** the sequence as the encoded string.

For example, **one way** to encode an original string `"abcdefghijklmnop"` might be:

- Split it as a sequence: `["ab", "cdefghijklmn", "o", "p"]`.
- Choose the second and third elements to be replaced by their lengths, respectively. The sequence becomes `["ab", "12", "1", "p"]`.
- Concatenate the elements of the sequence to get the encoded string: `"ab121p"`.

Given two encoded strings `s1` and `s2`, consisting of lowercase English letters and digits `1-9` (inclusive), return `true` *if there exists an original string that could be encoded as both* `s1` *and* `s2`. *Otherwise, return* `false`.

**Note** : The test cases are generated such that the number of consecutive digits in `s1` and `s2` does not exceed `3`.

### Example 1:

```
Input: s1 = "internationalization", s2 = "i18n"
Output: true
Explanation: It is possible that "internationalization" was the original string.
- "internationalization"
  -> Split:      ["internationalization"]
  -> Do not replace any element
  -> Concatenate: "internationalization", which is s1.
- "internationalization"
  -> Split:      ["i", "nternationalizatio", "n"]
  -> Replace:     ["i", "18",           "n"]
  -> Concatenate: "i18n", which is s2
```

### Example 2:

```
Input: s1 = "l123e", s2 = "44"
Output: true
Explanation: It is possible that "leetcode" was the original string.
- "leetcode"
  -> Split:      ["l", "e", "et", "cod", "e"]
  -> Replace:     ["l", "1", "2",  "3",  "e"]
  -> Concatenate: "l123e", which is s1.
- "leetcode"
  -> Split:      ["leet", "code"]
  -> Replace:     ["4",  "4"]
  -> Concatenate: "44", which is s2.
```

### Example 3:

```
Input: s1 = "a5b", s2 = "c5b"
Output: false
Explanation: It is impossible.
- The original string encoded as s1 must start with the letter 'a'.
- The original string encoded as s2 must start with the letter 'c'.
```

### Constraints:

- `1 <= s1.length, s2.length <= 40`
- `s1` and `s2` consist of digits `1-9` (inclusive), and lowercase English letters only.
- The number of consecutive digits in `s1` and `s2` does not exceed `3`.
