

2390. Removing Stars From a String

Description

You are given a string `s`, which contains stars `*`.

In one operation, you can:

- Choose a star in `s`.
- Remove the closest **non-star** character to its **left**, as well as remove the star itself.

Return *the string after all stars have been removed*.

Note:

- The input will be generated such that the operation is always possible.
- It can be shown that the resulting string will always be unique.

Example 1:

Input: `s = "leet**cod*e"`
Output: `"lecoe"`
Explanation: Performing the removals from left to right:
– The closest character to the 1st star is 't' in "lee t **cod*e". s becomes "lee*cod*e".
– The closest character to the 2nd star is 'e' in "le e *cod*e". s becomes "lecod*e".
– The closest character to the 3rd star is 'd' in "leco d *e". s becomes "lecoe".
There are no more stars, so we return "lecoe".

Example 2:

Input: `s = "erase*****"`
Output: `""`
Explanation: The entire string is removed, so we return an empty string.

Constraints:

- `1 <= s.length <= 105`
- `s` consists of lowercase English letters and stars `*`.
- The operation above can be performed on `s`.
