

# 809. Expressive Words

## Description

Sometimes people repeat letters to represent extra feeling. For example:

- "hello" -> "heeellooo"
- "hi" -> "hiii"

In these strings like "heeellooo", we have groups of adjacent letters that are all the same: "h", "eee", "ll", "ooo".

You are given a string `s` and an array of query strings `words`. A query word is **stretchy** if it can be made to be equal to `s` by any number of applications of the following extension operation: choose a group consisting of characters `c`, and add some number of characters `c` to the group so that the size of the group is **three or more**.

- For example, starting with "hello", we could do an extension on the group "o" to get "hellooo", but we cannot get "helloo" since the group "oo" has a size less than three. Also, we could do another extension like "ll" -> "lllll" to get "helllllloo". If `s = "helllllloo"`, then the query word "hello" would be **stretchy** because of these two extension operations: `query = "hello" -> "hellooo" -> "helllllloo" = s`.

Return *the number of query strings that are stretchy*.

### Example 1:

```
Input: s = "heeellooo", words = ["hello", "hi", "helo"]
Output: 1
Explanation:
We can extend "e" and "o" in the word "hello" to get "heeellooo".
We can't extend "helo" to get "heeellooo" because the group "ll" is not size 3 or more.
```

### Example 2:

```
Input: s = "zzzzzyyyy", words = ["zzyy","zy","zyy"]
Output: 3
```

### Constraints:

- `1 <= s.length, words.length <= 100`
- `1 <= words[i].length <= 100`
- `s` and `words[i]` consist of lowercase letters.
