

# 2330. Valid Palindrome IV

## Description

You are given a **0-indexed** string `s` consisting of only lowercase English letters. In one operation, you can change **any** character of `s` to any **other** character.

Return `true` *if you can make* `s` *a palindrome after performing exactly one or two operations, or return* `false` *otherwise*.

### Example 1:

```
Input: s = "abcdba"
Output: true
Explanation: One way to make s a palindrome using 1 operation is:
- Change s[2] to 'd'. Now, s = "abddba".
One operation could be performed to make s a palindrome so return true.
```

### Example 2:

```
Input: s = "aa"
Output: true
Explanation: One way to make s a palindrome using 2 operations is:
- Change s[0] to 'b'. Now, s = "ba".
- Change s[1] to 'b'. Now, s = "bb".
Two operations could be performed to make s a palindrome so return true.
```

### Example 3:

```
Input: s = "abcdef"
Output: false
Explanation: It is not possible to make s a palindrome using one or two operations so return false.
```

### Constraints:

- `1 <= s.length <= 105`
- `s` consists only of lowercase English letters.
