

# 925. Long Pressed Name

## Description

Your friend is typing his `name` into a keyboard. Sometimes, when typing a character `c`, the key might get *long pressed*, and the character will be typed 1 or more times.

You examine the `typed` characters of the keyboard. Return `True` if it is possible that it was your friends name, with some characters (possibly none) being long pressed.

### Example 1:

```
Input: name = "alex", typed = "aaleex"  
Output: true  
Explanation: 'a' and 'e' in 'alex' were long pressed.
```

### Example 2:

```
Input: name = "saeed", typed = "ssaaedd"  
Output: false  
Explanation: 'e' must have been pressed twice, but it was not in the typed output.
```

### Constraints:

- `1 <= name.length, typed.length <= 1000`
- `name` and `typed` consist of only lowercase English letters.
