

2620. Counter

Description

Given an integer `n`, return a `counter` function. This `counter` function initially returns `n` and then returns 1 more than the previous value every subsequent time it is called (`n`, `n + 1`, `n + 2`, etc).

Example 1:

Input:

```
n = 10
```

```
["call","call","call"]
```

Output: `[10,11,12]`

Explanation:

```
counter() = 10 // The first time counter() is called, it returns n.
```

```
counter() = 11 // Returns 1 more than the previous time.
```

```
counter() = 12 // Returns 1 more than the previous time.
```

Example 2:

Input:

```
n = -2
```

```
["call","call","call","call","call"]
```

Output: `[-2,-1,0,1,2]`

Explanation: `counter()` initially returns `-2`. Then increases after each subsequent call.

Constraints:

- `-1000 <= n <= 1000`
- `0 <= calls.length <= 1000`
- `calls[i] === "call"`
