

# 1853. Convert Date Format

[Leetcode Link](#)

## Problem

Given a table `Days` with a `day` column of date type, the goal is to write an SQL query that will convert each date in the table into a string formatted as "day\_name, month\_name day, year". The result table should be returned in any order, and the output must be case-sensitive.

## Example

Consider the following `Days` table:

1	
2	day
3	
4	2022-04-12
5	2021-08-09
6	2020-06-26
7	

The expected query result would be:

1	
2	day
3	
4	Tuesday, April 12, 2022
5	Monday, August 9, 2021
6	Friday, June 26, 2020
7	

## Approach

To solve this problem, MySQL's `DATE_FORMAT` function can be used. This function allows you to format a date value based on a given format pattern. The following format pattern can be used to achieve the required output:

```
1 %W, %M %e, %Y
```

This pattern will replace `%W` with the day name, `%M` with the month name, `%e` for the day number without leading zeros, and `%Y` for the year.

## Example

Let's walk through the problem example using this approach:

```
1 2022-04-12 -> DATE_FORMAT('2022-04-12', '%W, %M %e, %Y') -> Tuesday, April 12, 2022
2 2021-08-09 -> DATE_FORMAT('2021-08-09', '%W, %M %e, %Y') -> Monday, August 9, 2021
3 2020-06-26 -> DATE_FORMAT('2020-06-26', '%W, %M %e, %Y') -> Friday, June 26, 2020
```

## Solution

### SQL

To achieve the required result, we can write an SQL query as follows:

```
1 SELECT DATE_FORMAT(day, '%W, %M %e, %Y') AS day
2 FROM Days;
```
