

# 2264. Largest 3-Same-Digit Number in String

## Description

You are given a string `num` representing a large integer. An integer is **good** if it meets the following conditions:

- It is a **substring** of `num` with length `3`.
- It consists of only one unique digit.

Return *the maximum good integer as a string or an empty string `""` if no such integer exists*.

Note:

- A **substring** is a contiguous sequence of characters within a string.
- There may be **leading zeroes** in `num` or a good integer.

### Example 1:

**Input:** `num = "6 777 133339"`

**Output:** `"777"`

**Explanation:** There are two distinct good integers: `"777"` and `"333"`. `"777"` is the largest, so we return `"777"`.

### Example 2:

**Input:** `num = "23 000 19"`

**Output:** `"000"`

**Explanation:** `"000"` is the only good integer.

### Example 3:

**Input:** `num = "42352338"`

**Output:** `""`

**Explanation:** No substring of length 3 consists of only one unique digit. Therefore, there are no good integers.

### Constraints:

- `3 <= num.length <= 1000`
- `num` only consists of digits.
