

2108. Find First Palindromic String in the Array

Description

Given an array of strings `words`, return *the first palindromic string in the array*. If there is no such string, return *an empty string* `""`.

A string is **palindromic** if it reads the same forward and backward.

Example 1:

```
Input: words = ["abc","car","ada","racecar","cool"]
Output: "ada"
Explanation: The first string that is palindromic is "ada".
Note that "racecar" is also palindromic, but it is not the first.
```

Example 2:

```
Input: words = ["notapalindrome","racecar"]
Output: "racecar"
Explanation: The first and only string that is palindromic is "racecar".
```

Example 3:

```
Input: words = ["def","ghi"]
Output: ""
Explanation: There are no palindromic strings, so the empty string is returned.
```

Constraints:

- `1 <= words.length <= 100`
- `1 <= words[i].length <= 100`
- `words[i]` consists only of lowercase English letters.
