

267. Palindrome Permutation II

Description

Given a string `s`, return *all the palindromic permutations (without duplicates) of it*.

You may return the answer in **any order**. If `s` has no palindromic permutation, return an empty list.

Example 1:

```
Input: s = "aabb"  
Output: ["abba","baab"]
```

Example 2:

```
Input: s = "abc"  
Output: []
```

Constraints:

- `1 <= s.length <= 16`
- `s` consists of only lowercase English letters.
