

# 1821. Find Customers With Positive Revenue this Year

[Leetcode Link](#)

## Problem Explanation

In this problem, we are given a table `Customers` with information about the customer ID, the year, and the revenue they generated in that year. Our goal is to write an SQL query that reports the customers with positive revenue in the year 2021.

### Example

Let's consider the provided example:

Customers	customer_id	year	revenue
1	2018	50	1
2021	30	1	2020
70	2	2021	-50
3	2018	10	3
2016	50	4	2021
20			

We have to find customers with positive revenue in the year 2021. From the table above, we can see that customer 1 has a revenue of 30 in 2021, customer 2 has a revenue of -50, and customer 4 has a revenue of 20. Customer 3 has no revenue in 2021. Thus, our query should return customers 1 and 4, resulting in the following table:

Result table:	customer_id
1	4

## Approach

Since we only need to find customers with positive revenue in 2021, we can use a simple `SELECT` statement with a `WHERE` clause to filter for the specified year and a positive revenue condition.

### SQL Query

Here's the SQL query that we'll use:

```
1 SELECT customer_id
2 FROM Customers
3 WHERE year = 2021 AND revenue > 0;
```

This query selects the `customer_id` for all rows in the `Customers` table where the `year` is 2021 and the revenue is greater than zero.##  
Implementing the Query in Python, JavaScript, and Java

While the given problem is an SQL query problem, you might want to run the query in Python, JavaScript, or Java for some applications. Here's how you can do it using popular database libraries:

### Python

To execute the query in Python, we can use the `sqlite3` library. Make sure you have SQLite installed and configured on your system.

```
1 import sqlite3
2
3 # Connect to the SQLite database file
4 conn = sqlite3.connect('example.db')
5
6 # Create a cursor to interact with the database
7 c = conn.cursor()
8
9 # SQL query to find customers with positive revenue in 2021
10 query = """
11 SELECT customer_id
12 FROM Customers
13 WHERE year = 2021 AND revenue > 0;
14 """
15
16 # Execute the SQL query
17 c.execute(query)
18
19 # Fetch all results
20 results = c.fetchall()
21
22 # Print the results
23 for row in results:
24     print(row)
25
26 # Close connection
27 conn.close()
```

### JavaScript

To execute the query in JavaScript, you can use the `sqlite3` package, which can be installed via npm.

First, install the `sqlite3` package:

```
1 npm install sqlite3
```

Here's an example of how to run the query with the `sqlite3` package in JavaScript:

```
1 const sqlite3 = require('sqlite3').verbose();
2
3 // Open the SQLite database file
4 const db = new sqlite3.Database('./example.db', sqlite3.OPEN_READWRITE, (err) => {
5   if (err) {
6     console.error(err.message);
7   }
8 });
9
10 // SQL query to find customers with positive revenue in 2021
11 const query = `
12 SELECT customer_id
13 FROM Customers
14 WHERE year = 2021 AND revenue > 0;
15 `;
16
17 // Execute the SQL query
18 db.all(query, (err, rows) => {
19   if (err) {
20     throw err;
21   }
22
23   // Print the results
24   rows.forEach((row) => {
25     console.log(row);
26   });
27 });
28
29 // Close the connection
30 db.close((err) => {
```
