

# 510. Inorder Successor in BST II

## Description

Given a `node` in a binary search tree, return *the in-order successor of that node in the BST*. If that node has no in-order successor, return `null`.

The successor of a `node` is the node with the smallest key greater than `node.val`.

You will have direct access to the node but not to the root of the tree. Each node will have a reference to its parent node. Below is the definition for `Node`:

```
class Node {
    public int val;
    public Node left;
    public Node right;
    public Node parent;
}
```

### Example 1:

**Input:** `tree = [2,1,3], node = 1`

**Output:** `2`

**Explanation:** 1's in-order successor node is 2. Note that both the node and the return value is of Node type.

### Example 2:

**Input:** `tree = [5,3,6,2,4,null,null,1], node = 6`

**Output:** `null`

**Explanation:** There is no in-order successor of the current node, so the answer is null.

### Constraints:

- The number of nodes in the tree is in the range `[1, 104]`.
- `-105 <= Node.val <= 105`
- All Nodes will have unique values.

**Follow up:** Could you solve it without looking up any of the node's values?
