

# 128. Longest Consecutive Sequence

Medium   Union Find   Array   Hash Table

[Leetcode Link](#)

## Problem Description

The problem asks us to find the length of the longest sequence of consecutive numbers in an unsorted array called `nums`. A sequence of numbers is considered consecutive if every number follows the previous one without any gaps. For example, `[1, 2, 3]` is a consecutive sequence, but `[1, 3, 4]` is not. Our task is to find the longest such sequence in the given array.

The tricky part of this problem is that we need to come up with a solution that has a time complexity of  $O(n)$ . This means we cannot afford the luxury of sorting the array as it would typically require  $O(n * \log n)$  time. Thus, we must find a way to keep track of sequences efficiently, despite the order of elements being arbitrary.

## Intuition

To solve this problem in  $O(n)$  time, we need to think of a data structure that allows us to quickly check if an element exists in the set and if we can extend a consecutive sequence. A hash table, or in Python a set, is an ideal candidate because it allows us to query the existence of an element in constant  $O(1)$  time.

Here's the intuition for the solution approach:

- Convert the `nums` array into a set to eliminate duplicates and allow for  $O(1)$  existence checks. It takes  $O(n)$  time to convert the list to a set.
- We iterate through each number `x` in the original array. For each `x`, we have two conditions:
  - If `x - 1` is not in the set, `x` could be the start of a new sequence.
  - If `x - 1` is in the set, `x` is part of a sequence that started before `x` and we don't need to check it as it will already be covered when we check the beginning of its sequence.
- When we find a number `x` that is the start of a new sequence (because `x - 1` is not in the set), we then proceed to check how long this sequence is by continuously incrementing `y` (initialized as `x + 1`) as long as `y` is present in the set.
- Each time we extend the sequence, we update the length of the current sequence and update the answer `ans` if the current sequence is longer than the previously recorded longest sequence.

This approach guarantees we only make a constant number of passes through the array and that we only consider each sequence from its beginning, ensuring our algorithm runs in  $O(n)$  time.

## Solution Approach

The solution approach can be decomposed into key steps that align with the algorithmic design and utilize data structures such as hash tables effectively.

**Step 1: Building a Set** Firstly, we convert the given list `nums` into a set `s`. This process removes any duplicate elements and facilitates constant time checks for the presence of integers. This is critical as it allows for the linear time algorithm we're aiming for.

```
1 s = set(nums)
```

**Step 2: Iteration and Sequence Detection** We iterate through each number `x` in the list `nums`. For each number, we check if its predecessor (`x - 1`) is in the set.

```
1 for x in nums:
2     if x - 1 not in s:
```

If `x - 1` is not in the set, it implies that `x` could potentially be the start of a new consecutive sequence.

**Step 3: Extension of the Sequence** When we find that `x` could be the start of a sequence, we try to find out where the sequence ends. We initialize a variable `y` as `x + 1` and while `y` is in the set, we keep incrementing `y` by one to extend the sequence.

```
1 y = x + 1
2 while y in s:
3     y += 1
```

**Step 4: Update Longest Sequence Length** After we find a sequence starting with `x` and ending before `y`, the length of this sequence is `y - x`. If this length is greater than any previously found sequences, we update our answer `ans`.

```
1 ans = max(ans, y - x)
```

**Step 5: Return the Result** Once we've considered each number in the array, we return `ans` as the answer to the problem, which represents the length of the longest consecutive elements sequence found.

This approach takes advantage of the hash table pattern via the set `s`, which provides us with the constant time lookups needed to achieve an overall  $O(n)$  time complexity. Thus, we harness the capability of hash tables to manage our computations efficiently and satisfy the problem's constraints.

## Example Walkthrough

Let's illustrate the solution approach using a small example. Consider the unsorted array `nums = [4, 1, 3, 2, 6]`. Our goal is to find the longest sequence of consecutive numbers in this array.

### Step 1: Building a Set

We transform the `nums` array into a set:

```
1 s = set([4, 1, 3, 2, 6]) # s = {1, 2, 3, 4, 6}
```

Duplications are removed and we can check for existence in constant time.

### Step 2: Iteration and Sequence Detection

We iterate through `nums`. Assume our iteration order is the same as the array's order.

Iteration 1: `x = 4`

- We check if `3 (x - 1)` is in the set:

```
1 if 3 not in s: # False, hence we skip
```

Since `3` is present, `4` is not the start of a new sequence.

Iteration 2: `x = 1`

- We check if `0 (x - 1)` is in the set:

```
1 if 0 not in s: # True, thus 1 might be a sequence start
```

Since `0` is not present, `1` is a start of a new sequence.

### Step 3: Extension of the Sequence

We extend the sequence from `1` onwards to find its length:

```
1 y = 2
2 while y in s:
3     y += 1 # y becomes 3, then 4, stops at 5
```

The sequence we found is `1, 2, 3, 4`.

### Step 4: Update Longest Sequence Length

We calculate the length of the current sequence `4 - 1` which is `3`.

```
1 ans = max(ans, 4 - 1) # if ans was 0, it becomes 3
```

We update `ans` to the length of this sequence if it is the longest found so far.

Iterations continue with `2, 3`, and `6` but no other new sequence is found with a length greater than `3`.

### Step 5: Return the Result

After iterating through all numbers, the longest sequence found is from `1` to `4`, which has a length of `4`. Thus, `ans = 4` and is returned as the solution.

## Python Solution

```
1 class Solution:
2     def longestConsecutive(self, nums: List[int]) -> int:
3         # Create a set from the list for O(1) lookups
4         num_set = set(nums)
5         longest_streak = 0
6
7         # Iterate over each number in the list
8         for number in nums:
9             # Check if it's the start of a sequence
10            if number - 1 not in num_set:
11                # Initialize the current number as the possible start of a sequence
12                current_num = number
13                current_streak = 1
14
15                # Increment the current_num to find the length of the streak
16                while current_num + 1 in num_set:
17                    current_num += 1
18                    current_streak += 1
19
20                # Update the longest_streak with the maximum streak found
21                longest_streak = max(longest_streak, current_streak)
22
23        # Return the length of the longest consecutive sequence
24        return longest_streak
25
```

## Java Solution

```
1 class Solution {
2     public int longestConsecutive(int[] nums) {
3         // Create a hash set to store the unique elements of the array.
4         Set<Integer> numSet = new HashSet<>();
5
6         // Add all elements to the set.
7         for (int num : nums) {
8             numSet.add(num);
9         }
10
11        // Initialize the variable for the longest consecutive sequence.
12        int longestStreak = 0;
13
14        // Go through each element in the array.
15        for (int num : nums) {
16            // Check if current number is the beginning of a sequence.
17            if (!numSet.contains(num - 1)) {
18                // Initialize the current number as the potential start of the sequence.
19                int currentNum = num;
20                // Initialize the current streak length.
21                int currentStreak = 1;
22
23                // Expand the current streak if consecutive numbers are found.
24                while (numSet.contains(currentNum + 1)) {
25                    currentNum += 1;
26                    currentStreak += 1;
27                }
28
29                // Update the longest streak found so far.
30                longestStreak = Math.max(longestStreak, currentStreak);
31            }
32        }
33
34        // Return the longest streak length.
35        return longestStreak;
36    }
37 }
38
```

## C++ Solution

```
1 #include <vector>
2 #include <unordered_set>
3 #include <algorithm>
4
5 class Solution {
6 public:
7     int longestConsecutive(vector<int>& nums) {
8         // Create an unordered set to hold unique elements for constant-time lookups.
9         unordered_set<int> numSet(nums.begin(), nums.end());
10        int longestStreak = 0; // Variable to store the length of the longest consecutive sequence found.
11
12        // Iterate over each element in the vector.
13        for (int num : nums) {
14            // Check if the current number is the beginning of a sequence by looking for num - 1.
15            if (!numSet.count(num - 1)) {
16                // Initialize the current number as the start of a sequence, look for all consecutive numbers starting with num + 1.
17                int currentNum = num + 1;
18
19                // Continue checking for the next consecutive number in the sequence.
20                while (numSet.count(currentNum)) {
21                    currentNum++;
22                }
23
24                // Update the longest streak with the length of the current sequence.
25                longestStreak = max(longestStreak, currentNum - num);
26            }
27        }
28
29        // Return the longest length of consecutive sequence found.
30        return longestStreak;
31    }
32 };
33
```

## Typescript Solution

```
1 // Function to find the length of the longest consecutive elements sequence.
2 function longestConsecutive(nums: number[]): number {
3     // Initialising a set to store unique numbers from the input.
4     const numSet: Set<number> = new Set(nums);
5     let longestStreak = 0; // Stores the length of the longest consecutive sequence.
6
7     // Iterate over each number in the set.
8     for (const num of numSet) {
9         // Check if current number is the beginning of a sequence.
10        if (!numSet.has(num - 1)) {
11            let currentNum = num; // Starting number of the current sequence.
12            let currentStreak = 1; // Initializing current streak length.
13
14            // Incrementally check consecutive numbers.
15            while (numSet.has(currentNum + 1)) {
16                currentNum++;
17                currentStreak++;
18            }
19
20            // Update the longest streak if current one is longer.
21            longestStreak = Math.max(longestStreak, currentStreak);
22        }
23    }
24    // Return the length of the longest consecutive sequence.
25    return longestStreak;
26 }
27
```

## Time and Space Complexity

The given code is designed to find the length of the longest consecutive elements sequence in an unsorted array. It utilizes a set to achieve an average time complexity of  $O(n)$ .

### Time Complexity:

The algorithm has two main parts:

- Creating a set from the list of numbers, which takes  $O(n)$  time.
- Looping through each number in the array and extending the consecutive sequence if the current number is the start of a sequence. This part is also  $O(n)$  on average because each number is visited only once during the sequence extension process.

Combining these two parts still results in a total of  $O(n)$  time complexity since other operations inside the loop are constant time on average, such as checking for membership in the set and updating the `ans` variable.

### Space Complexity:

The space complexity is  $O(n)$  because a set is created to store the elements of the array, and no other data structures that depend on the size of the input are used.
