# 899. Orderly Queue

## Description

You are given a string s and an integer k. You can choose one of the first k letters of s and append it at the end of the string.

Return the lexicographically smallest string you could have after applying the mentioned step any number of moves.

#### Example 1:

```
Input: s = "cba", k = 1
Output: "acb"
Explanation:
In the first move, we move the 1 st character 'c' to the end, obtaining the string "bac".
In the second move, we move the 1 st character 'b' to the end, obtaining the final result "acb".
```

#### **Example 2:**

```
Input: s = "baaca", k = 3
Output: "aaabc"
Explanation:
In the first move, we move the 1 st character 'b' to the end, obtaining the string "aacab".
In the second move, we move the 3 rd character 'c' to the end, obtaining the final result "aaabc".
```

### **Constraints:**

- 1 <= k <= s.length <= 1000
- s consist of lowercase English letters.
