2183. Count Array Pairs Divisible by K

Leetcode Link

Problem Description

Given an array nums and an integer k, we have to find the number of pairs (i, j) such that the product of nums[i] and nums[j] is divisible by k. Note that k can be as large as 1e5.

Here's a high-level approach to solving this problem:

- 1. Calculate the greatest common divisor (gcd) of each value in nums with k.
- 2. Then, for each pair (nums[i], nums[j]), check if their gcd values multiplied together are divisible by k. If yes, add them to the count.

Let's walk through an example to better understand the approach.

Example

```
Suppose nums = [1, 2, 3, 4, 5] and k = 6. We first find the gcd values for each element in the array nums with k.
```

```
1 \times 6 = 6, gcd(1, 6) = 12 \times 3 = 6, gcd(2, 6) = 23 \times 2 = 6, gcd(3, 6) = 34 \times 1.5 = 6, gcd(4, 6) = 25 \times 1.2 = 6, gcd(5, 6) = 1
```

Now the gcd values are [1, 2, 3, 2, 1].

We go through each pair of gcd values and check if their product is divisible by k. In our example:

```
(1, 2) - No (1, 3) - No (1, 2) - No (1, 1) - No (2, 3) - Yes (2, 2) - No (2, 1) - No (3, 2) - Yes (3, 1) - No (2, 1) - No
```

We find two pairs that are divisible by k: (2, 3) and (3, 2). So the final answer is 2.

Solution

```
Python
```

```
2 python
   from math import gcd
    from typing import List
   class Solution:
       def countPairs(self, nums: List[int], k: int) -> int:
            ans = 0
           gcds = \{\}
10
11
12
            for num in nums:
13
                gcd_num = gcd(num, k)
                for gcd_val, count in gcds.items():
14
                    if gcd_num * gcd_val % k == 0:
15
16
                        ans += count
17
                gcds[gcd_num] = gcds.get(gcd_num, 0) + 1
18
19
            return ans
```

Java

```
java
    import java.util.HashMap;
    import java.util.Map;
   class Solution {

29
                return a;
30
           } else {
                return GCD(b, a % b);
```

return GCD(b, a % b);

return GCD(b, a % b);

ln conclusion, the above solutions follow the high-level approach explained earlier and find the count of pairs such that their product is divisible by k. Each solution utilizes the greatest common divisor (gcd) function to calculate the gcd values, iterate through each

pair of gcd values, and check if their product is divisible by k. The implementation is provided in Python, Java, JavaScript, C++, and
