# 2585. Number of Ways to Earn Points

# Description

```
There is a test that has n types of questions. You are given an integer target and a 0-indexed 2D integer array types where types[i] = [count i, marks i] indicates that there are count i questions of the i th type, and each one of them is worth marks i points.
```

Return the number of ways you can earn exactly target points in the exam. Since the answer may be too large, return it modulo 109 + 7.

**Note** that questions of the same type are indistinguishable.

• For example, if there are 3 questions of the same type, then solving the 1 st and 2 nd questions is the same as solving the 1 st and 3 rd questions, or the 2 nd and 3 rd questions.

## Example 1:

```
Input: target = 6, types = [[6,1],[3,2],[2,3]]
Output: 7
Explanation: You can earn 6 points in one of the seven ways:
- Solve 6 questions of the 0 th type: 1 + 1 + 1 + 1 + 1 + 1 = 6
- Solve 4 questions of the 0 th type and 1 question of the 1 st type: 1 + 1 + 1 + 1 + 2 = 6
- Solve 2 questions of the 0 th type and 2 questions of the 1 st type: 1 + 1 + 2 + 2 = 6
- Solve 3 questions of the 0 th type and 1 question of the 2 nd type: 1 + 1 + 1 + 3 = 6
- Solve 1 question of the 0 th type, 1 question of the 1 st type and 1 question of the 2 nd type: 1 + 2 + 3 = 6
- Solve 3 questions of the 1 st type: 2 + 2 + 2 = 6
- Solve 2 questions of the 2 nd type: 3 + 3 = 6
```

#### Example 2:

```
Input: target = 5, types = [[50,1],[50,2],[50,5]]
Output: 4
Explanation: You can earn 5 points in one of the four ways:
- Solve 5 questions of the 0 th type: 1 + 1 + 1 + 1 + 1 = 5
- Solve 3 questions of the 0 th type and 1 question of the 1 st type: 1 + 1 + 1 + 2 = 5
- Solve 1 questions of the 0 th type and 2 questions of the 1 st type: 1 + 2 + 2 = 5
- Solve 1 question of the 2 nd type: 5
```

### Example 3:

```
Input: target = 18, types = [[6,1],[3,2],[2,3]]
Output: 1
Explanation: You can only earn 18 points by answering all questions.
```

#### **Constraints:**

- 1 <= target <= 1000
- n == types.length
- 1 <= n <= 50
- types[i].length == 2
- 1 <= count  $_i$  , marks  $_i$  <= 50
