684. Redundant Connection

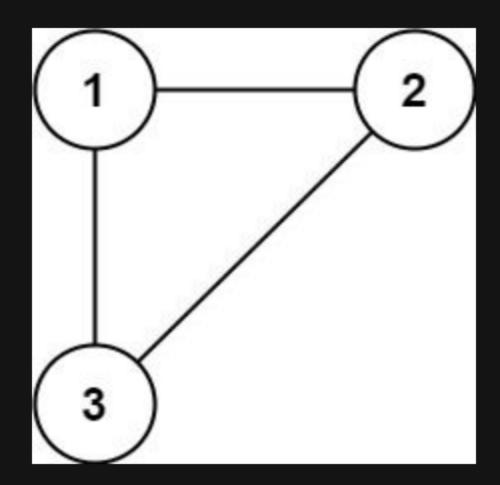

Description

In this problem, a tree is an undirected graph that is connected and has no cycles.

You are given a graph that started as a tree with $\begin{bmatrix} n \end{bmatrix}$ nodes labeled from $\begin{bmatrix} 1 \end{bmatrix}$ to $\begin{bmatrix} n \end{bmatrix}$, with one additional edge added. The added edge has two **different** vertices chosen from $\begin{bmatrix} 1 \end{bmatrix}$ to $\begin{bmatrix} n \end{bmatrix}$, and was not an edge that already existed. The graph is represented as an array $\begin{bmatrix} edges \end{bmatrix}$ of length $\begin{bmatrix} n \end{bmatrix}$ where $\begin{bmatrix} edges \end{bmatrix} = \begin{bmatrix} a_i, b_i \end{bmatrix}$ indicates that there is an edge between nodes $\begin{bmatrix} a_i \end{bmatrix}$ and $\begin{bmatrix} b_i \end{bmatrix}$ in the graph.

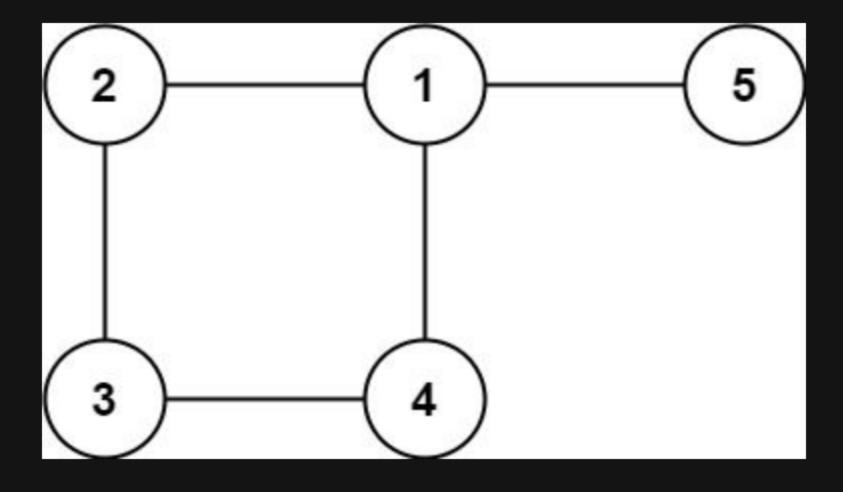

Return an edge that can be removed so that the resulting graph is a tree of n nodes. If there are multiple answers, return the answer that occurs last in the input.

Example 1:

Input: edges = [[1,2],[1,3],[2,3]]
Output: [2,3]

Example 2:

Input: edges = [[1,2],[2,3],[3,4],[1,4],[1,5]]
Output: [1,4]

Constraints:

- n == edges.length
- 3 <= n <= 1000
- edges[i].length == 2
- $1 \ll a_i \ll b_i \ll edges.length$
- a i != b i
- There are no repeated edges.
- The given graph is connected.
