2796. Repeat String

Description

Write code that enhances all strings such that you can call the `string.replicate(x)` method on any string and it will return repeated string `x` times.

Try to implement it without using the built-in method `string.repeat` .

Example 1:

```
Input: str = "hello", times = 2
Output: "hellohello"
Explanation: "hello" is repeated 2 times
```

Example 2:

```
Input: str = "code", times = 3
Output: "codecodecode"
Explanation: "code" is repeated 3 times
```

Example 3:

```
Input: str = "js", times = 1
Output: "js"
Explanation: "js" is repeated 1 time
```

Constraints:

- `1 <= str.length, times <= 10` ^{5}
