# 1528. Shuffle String

Description

You are given a string `s` and an integer array `indices` of the **same length**. The string `s` will be shuffled such that the character at the `i`th position moves to `indices[i]` in the shuffled string.

Return *the shuffled string*.

Example 1:

```
Input: s = "codeleet",  indices = [4,5,6,7,0,2,1,3]
Output: "leetcode"
Explanation: As shown, "codeleet" becomes "leetcode" after shuffling.
```

Example 2:

```
Input: s = "abc",  indices = [0,1,2]
Output: "abc"
Explanation: After shuffling, each character remains in its position.
```

Constraints:

- `s.length == indices.length == n`
- `1 <= n <= 100`
- `s` consists of only lowercase English letters.
- `0 <= indices[i] < n`
- All values of `indices` are **unique**.
